

45-ISEA Summer Field Log (Sample)

45-ISEA Summer Field Log. This fictional log demonstrates how an expedition report is archived. The summer field team worked from Maitri between 8 January 2026 and 21 January 2026. Daily planning meetings were held at 0800 hours and all field parties carried satellite messengers.

SAMPLE

Weather-station servicing. The team serviced 6 automatic weather stations along the coastal traverse. Batteries were replaced at 4 stations and one wind sensor was recalibrated. Recorded air temperature during the servicing period ranged from -12.4 °C to 2.1 °C.

SAMPLE

Snow and sea-ice observations. The team dug 12 snow pits and recorded density every 10 cm. Fast ice near the landing site was observed to break up in the final week of the campaign. Photographs and field sheets were uploaded to the internal archive for review.
